Overview

Pyrukynd is a medicine used to treat adults with pyruvate kinase deficiency (PKD), an inherited disease that causes red blood cells to break down faster than normal.

Pyrukynd is also used to treat anaemia (low levels of red blood cells) in adults with alpha or beta thalassaemia (inherited blood disorders in which patients do not have enough normal haemoglobin, the protein in red blood cells that carries oxygen around the body). It can be used in patients who require regular blood transfusions (transfusion-dependent thalassemia) and those who do not require regular transfusions (non–transfusion-dependent thalassemia).

These conditions are rare, and Pyrukynd was designated an 'orphan medicine' (a medicine used in rare diseases).

Pyrukynd contains the active substance mitapivat.

Product details

Name of medicine

Pyrukynd

Active substance

mitapivat sulfate

International non-proprietary name (INN) or common name

mitapivat

Therapeutic area (MeSH)

- Genetic Diseases, Inborn
- Anemia, Hemolytic

Anatomical therapeutic chemical (ATC) code

B06AX04

Pharmacotherapeutic group

Other hematological agents

Therapeutic indication

Pyrukynd is indicated for the treatment of pyruvate kinase deficiency (PK deficiency) in adult patients (see section 4.4).

Authorisation details

EMA product number

EMEA/H/C/005540

▼ Additional monitoring

This medicine is under additional monitoring, meaning that it is monitored even more intensively than other medicines. For more information, see Medicines under additional monitoring.

Orphan

This medicine was designated an orphan medicine. This means that it was developed for use against a rare, life-threatening or chronically debilitating condition or, for economic reasons, it would be unlikely to have been developed without incentives. For more information, see Orphan designation.
